There was no change in the index of the synapse from 0.058 ± 0.005 in the vehicle group to 0.063 ± 0.002 in the 30 mM group (Student's *t*-test, *p* = 0.5917, *n* = 6; [Figure 2](#ijms-19-02208-f002){ref-type="fig"}A,B). These results indicate that synaptic protein levels are not changed by 30 mM H₂O₂. 3. Discussion {#sec3-ijms-19-02208} ===== In the present study, we examined whether 30 mM H₂O₂ could affect the density of synaptic vesicles. We applied the fractionation method to detect the amount of synaptic vesicles in synaptosomes and counted the number of synaptic vesicles in 50 nm width from electron micrographs of axons to examine synaptic vesicle density. There was no change in the total number of vesicles in both the vehicle-treated and H₂O₂-treated groups. These results indicate that the density of synaptic vesicles was not changed in H₂O₂-treated group. Therefore, we conclude that the level of H₂O₂ in the H₂O₂-treated group is too low to affect the total number of synaptic vesicles in the present experiment. Vesicular glutamate transporters (VGLUTs) are a family of vesicle-associated transporters that transport glutamate into vesicles and transport glutamate from vesicles to the extracellular space. It is now generally accepted that VGLUTs are localized to presynaptic nerve terminals and mediate glutamate neurotransmitter release \[@B20-ijms-19-02208]. In addition, 2d92ce491b
