F4XY85, on the other hand, is a higher-resolution driver, that can print an image using 16 color and a resolution of 1200x600 dpi (dots per inch). But at a price of ~\$50 the product costs twice as much as a similar Canon printer. With respect to the discussion in the comments, this article about the Canon LBP-810 Printer is still correct, but the link to the driver is broken and the page where to download the driver no longer exists. Canon LBP-810 Printer Settings and Manual Printing an image is quite easy. You just need to print an image, which is saved on a computer. There is nothing special about the Canon LBP-810 printer settings; they are very similar to the other Canon printers, with only a little difference. But you should be aware that you will be printing photos at a lower quality, since the Canon LBP-810 printer cannot print at a resolution of more than 600 dpi. The manual of the Canon LBP-810 printer is also similar to the other Canon printers, with only a few additions. First of all, you can choose the paper size (Canon recommend A4, letter or legal). There is also a detailed user manual, which you can find here. You should also be aware that you need to change the language settings in the printer driver to get the right language.
