Robert March (Física para poetas) Ciencia para poetas (Robert March) Apr 13, 2017. The seller of this item was an. Robert March is a physics educator who worked at his home in New England. Main menu Fashion: Claire Foley Claire Foley was born and raised in Reading. She lives in London. In 2006 she made a collection of dresses in black and white to use on the catwalk. We like her simplicity and minimalism. We love her ability to combine print and a play with black and white. “

facultyQ: How to implement a
polymorphic "is a" relationship

with Laravel's ORM? I'm designing an ORM in PHP, but I can't come up with a way to implement a polymorphic "is a" relationship. The only workaround I found was to create a new model just for the association and use a `BelongsToMany` relationship between them, which is not what I want. What I want is the following. Consider the following two models, `Cart` and `Order`. `Order` has a `HasMany` relationship with `CartItem`, a `Cart` has a `HasMany` relationship with `CartItem`. How

do I model this relationship so that I can perform queries like `$order->lineItems->contains($item)` and `$order->cart->lineItems->contains($item)` at the same time? I'm using Eloquent with Laravel. A: In Eloquent you can model polymorphic relationship using traits. In your case: `class LineItem extends Eloquent { protected $table = 'lineitems'; protected $morphClass = 'LineItem'; } class Cart extends Eloquent { public function items() { return $this->morphMany('LineItem',`

```
'item', 'cart'); } } $order =  
Order::find(1);  
$order->items->contains($item);  
$order = Order::find(1); $order->c  
art->items->contains($item); Note  
that if you want to use many-to-  
many relationship you have to  
change line protected $morphClass  
= 'LineItem'; to protected  
$morphTo = 'LineItem'; Q: Искать
