The quality of the data is excellent, the sample is large and socio-demographically representative of the population, and the researcher was blinded to the case v. control status of the sample. Although this study is useful for investigating the relationship between depression, anger and physical health, and a cause for discussion and further research, it is notable that many of the conclusions are drawn from bivariate analyses without adjusting for other variables, in particular other psychological and psychiatric variables, for example depression, anxiety and anger. Authors' Response: We thank the reviewer for his comment. However, we agree with the reviewer that adjustment for other psychological and psychiatric variables is essential for determining the independent association of anger and health. In addition, many studies on the relationship between anger and health have used the experience of physical symptoms as the dependent variable, instead of physical health.
